The Trust Problem

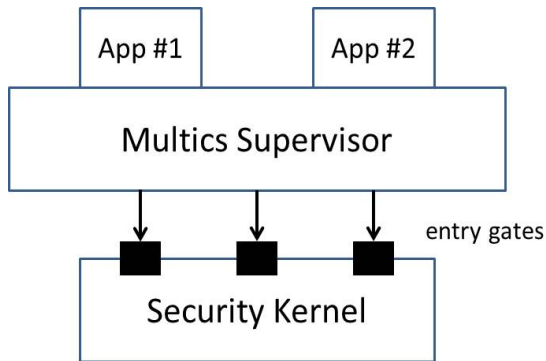

Description

How the execution of an application can be secured in the face of a compromised operating system ?

Motivation

- The rise of services requiring trusted platforms with proved security;
- Operating systems of real-world systems are inherently insecure:
 - 1 Complexity and unsafe languages;
 - 2 Poor isolation.

The Multics Project – SOSF '75

The Security Kernel

Where should it be placed ?

- 1 monolithic operating system: Unix-like systems;

The Security Kernel

Where should it be placed ?

- 1 monolithic operating system: Unix-like systems;
- 2 special hardware processor: AEGIS and XOMOS;

The Security Kernel

Where should it be placed ?

- 1 monolithic operating system: Unix-like systems;
- 2 special hardware processor: AEGIS and XOMOS;
- 3 micro-kernel: SeL4;

The Security Kernel

Where should it be placed ?

- ① monolithic operating system: Unix-like systems;
- ② special hardware processor: AEGIS and XOMOS;
- ③ micro-kernel: SeL4;
- ④ specialized OS: TLR.

The Security Kernel

Where should it be placed ?

- 1 monolithic operating system: Unix-like systems;
- 2 special hardware processor: AEGIS and XOMOS;
- 3 micro-kernel: SeL4;
- 4 specialized OS: TLR.

Design Purpose

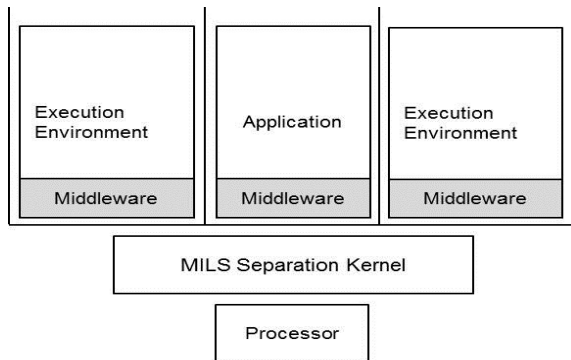

To enable the coexistence of different systems requiring different levels of security on the same platform.

Design Requirements

- *tamper proof*: it cannot be modified or disabled by rogue application;
- *always invoked*: all inter-partition communication request must go through it;
- *evaluable*: its correctness can be validated.

Definition

SEE is a processing environment that guarantees the following properties:

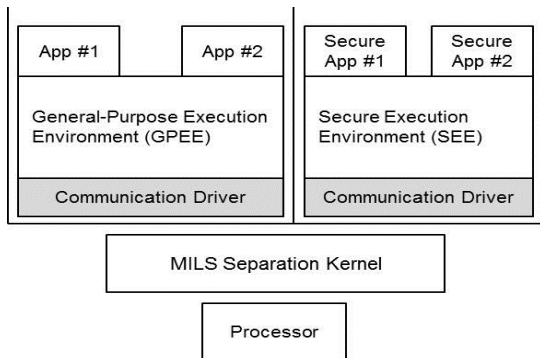

- *authenticity*: the code under execution should not have been changed;
- *integrity*: runtime states should not have been tampered with;
- *privacy*: code, data and runtime states should not have been observable by unauthorized applications.

Overview

Definition

The Dual-EE

The Dual-Execution-Environment is a security architecture where both a Separation Kernel and a Secure Execution Environment play the role of Security Kernel.

Theorem

Theorem

Let S be a system in which the security kernel is based on a separation kernel. If the requirements of all secure applications are equivalent, then all multi-execution-environment architecture can be reduced to a dual-execution-environment architecture.

Theorem

Theorem

Let S be a system in which the security kernel is based on a separation kernel. If the requirements of all secure applications are equivalent, then all multi-execution-environment architecture can be reduced to a dual-execution-environment architecture.

Sketch of proof

Let S be multi-EE architecture. Without loss of generality, we suppose that S is a system which contains 4 execution environments, 2 of which are non-secure and 2 are secure...

 - Perspectives

Isolation Properties

- 1 **Data (spatial) separation.** Data within one partition cannot be read or modified by other partitions;
- 2 **Sanitization (temporal separation).** Shared resources cannot be used to leak information into other partitions;
- 3 **Control of information flow.** Communication between partitions cannot occur unless explicitly permitted;
- 4 **Fault isolation.** Security breach in one partition cannot spread to other partitions.

Functional Properties

- 1 **Protected Execution.** no interference caused by malicious software;
- 2 **Sealed Storage.** protecting the integrity, secrecy and freshness of data;
- 3 **Protected Input/Output.** protecting the integrity and secrecy of input/output data;
- 4 **Attestation.** authentication to remote trusted parties.

Ease-of-Deployment Properties

- 1 **Support of Legacy Systems.** required modifications for a system to run on a separation kernel;
- 2 **Cost.** extra silicon;
- 3 **Overhead.** separation kernel impact on performance;
- 4 **SEE Performance.** how fast complex operations are executed by SEE.

Dual-EE Technologies

- External hardware module: smart cards;
- Bare-metal hypervisor: KVM/ARM;
- Special processor extensions: ARM TrustZone.

ARM TrustZone

Summary of Evaluation

Comparison Category	Comparison Criteria	<i>Smart Card</i>	<i>KVM</i>	<i>TrustZone</i>
Security Requirements	Protected Execution	✓	✓	✓
	Sealed Storage	✓	×	✓*
	Protected Input	×	✓	✓
	Protected Output	×	✓	✓
	Attestation	✓	×	✓*
Isolation Properties	Data Separation	HW	SW	HW
	Information Flow Control	SW	SW	HW
	Sanitization	HW	SW	HW/SW
	Damage Limitation	HW	SW	HW
Deployability Criteria	Legacy Systems	✓	✓	✓
	Low Overhead	✓	×	✓
	Low Cost	×	×	✓*
	High Performance	×	✓	✓

✓: satisfies the criterion; ×: does not satisfy the criterion;

✓*: needs widely available additional hardware modules to satisfy the criterion;

HW: satisfied by hardware module; SW: satisfied by software implementation.

Discussion

- Bare-metal hypervisors achieve the lowest score;

Discussion

- Bare-metal hypervisors achieve the lowest score;
- External hardware modules do not fit to certain kind of applications that need user interaction and high processing speed;

Discussion

- Bare-metal hypervisors achieve the lowest score;
- External hardware modules do not fit to certain kind of applications that need user interaction and high processing speed;
- TrustZone provides a balanced compromise.

- 5 Conclusion
 - **Summary**
 - Perspectives

Summary

- The dual-EE is an interesting approach related to the trust problem;
- We provided a convenient abstract model to better represent the characteristics of the dual-EE approach;
- Our model was examined by revisiting the literature.

Outline

- 1 Introduction

 - Summary
 - Perspectives

Perspectives

- Include primitives defined in the MILS architecture to our core properties;
- Use the dual-EE approach to design a better **Trusted Execution Environment (TEE)**.

Thank you for your attention!
